PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b> 10/509,201	<b>Applicant(s)</b> MOON, SEUNG-HWAN	
	<b>Examiner</b> JASON M. MANDEVILLE	<b>Art Unit</b> 2629	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 12 March 2008.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-3,5-7 and 10-15 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-3,5-7 and 10-15 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 24 September 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All    b) ☐ Some \*    c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12 March 2008 has been entered.

### ***Claim Rejections - 35 USC § 112***

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. **Claims 3 and 5-7** are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. These claims all recite "an operation control signal." However, an "operation control signal" is previously recited in **Claim 2**, from which **Claims 3 and 5-7** ultimately depend. Therefore, it is unclear whether "an operation control signal" of **Claims 3 and 5-7** refers back

Art Unit: 2629

to the "operation control signal" defined in **Claim 2** or whether "an operation control signal" is a different control signal. For the purposes of examination, the examiner assumes that the "operation control signal" of **Claims 3 and 5-7** refers back to the "operation control signal" of **Claim 2**.

4. **Claims 12-15** are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The claims recite "wherein the provision includes" or "wherein the provision compares." This "provision" appears to refer back to a "providing" as recited previously in **Claim 12**. However, there are two instances of a "providing" recited previously in **Claim 12**, one "providing data voltages" to the "data line" and one "providing a gate voltage to the gate line." The claim language makes these claims ambiguous and indefinite. The examiner assumes for the purposes of examination that the "provision" refers to "providing data voltages" to the "data line."

### ***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which

Art Unit: 2629

said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. **Claims 1-3, 5-7, and 11-15** are rejected under 35 U.S.C. 103(a) as being unpatentable over Montalbo (US 6,356,260) in view of Sekido et al. (hereinafter "Sekido" US 2003 / 0048249) and further in view of Hiraki et al. (hereinafter "Hiraki" US 6,680,722).

7. As pertaining to **Claim 1**, Montalbo discloses (see Fig. 1 and Fig. 2) a liquid crystal display (see Col. 1, Ln. 14-18) comprising:

a liquid crystal panel assembly (10; see Fig. 1) including a plurality of gate lines (i.e., row lines), a plurality of data lines (i.e., column lines) which intersects the gate lines (i.e., row lines; see Col. 1, Ln. 19-48), and a plurality of pixels each of which is formed in an area defined by a data line (i.e., column line) of the data lines (i.e., column lines) and a gate line (i.e., row line) of the gate lines (i.e., row lines) and has a switching element (i.e., TFT) connected to the gate line (i.e., row line) and the data line (i.e., column line; again, see Col. 1, Ln. 19-48);

a gate driver (150) for supplying gate voltages (i.e., driving voltages) to the gate lines (i.e., row lines; again, see Col. 1, Ln. 19-48);

at least one data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3) for supplying data voltages corresponding to image data (i.e., pixel data) to the data lines (i.e., column lines; see Col. 1, Ln. 19-60); and

Art Unit: 2629

a timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 and (700) of Fig. 7) for comparing (see Fig. 5, for example) nth image data (i.e., current pixel data (520)) applied from outside and (n-1)th image data (i.e., previous pixel data (510)) stored therein and selectively providing the nth image data (i.e., current pixel data (520)) to the data driver (120, 200, 320) depending on the comparison result (see Col. 6, Ln. 66-67 through Col. 7, Ln. 1-54), wherein the timing controller (130, 330, 500) does not provide the nth image data (i.e., current pixel data (520)) to the data driver (120, 200, 320) when all bits of the nth image data (i.e., current pixel data (520)) and the (n-1)th image data (i.e., previous pixel data (510)) are equal (i.e., the same; see Col. 6, Ln. 46-67 through Col. 7, Ln. 1-54).

Montalbo does not explicitly disclose that the timing controller (130, 330, 500, 700) also does not provide the nth image data (i.e., current image data (520)) to the data driver (120, 200, 320) when all bits of the nth image data (i.e., current image data (320)) and the (n-1)th image data (i.e., previous image data (510)) are complementary to each other. However, Montalbo does disclose that the primary goal of the invention is to reduce power consumption and electromagnetic interference by reducing the transfer of data from the timing controller to the data driver (see Col. 6, Ln. 34-65).

Sekido discloses (see Fig. 1, Fig. 3, and Fig. 5) a liquid crystal panel assembly (1; see Fig. 1) including a plurality of gate lines (5), a plurality of data lines (6) which intersects the gate lines (5), and a plurality of pixels (3) each of

Art Unit: 2629

which is formed in an area defined by a data line (6) of the data lines (6) and a gate line (5) of the gate lines (5) and has a switching element (i.e., TFT; 4) connected to the gate line (5) and the data line (6; see Page 2, Para. [0024]-[0025]). Further, Sekido discloses that the assembly comprises a gate driver (22; see Fig. 3) for supplying gate voltages to the gate lines (5) and at least one data driver (20; see Fig. 3) for supplying data voltages corresponding to image data to the data lines (see Page 3, Para. [0031] and [0034]). Sekido discloses a timing controller (implicit in (40, G1, G2; see Fig. 5) for comparing nth image data (i.e., pixel data of the next pixel) applied from outside and (n-1)th image data (i.e., pixel data of the previous pixel) stored therein and selectively providing the nth image data (i.e., pixel data of the next pixel) to the data driver (i.e., 20 in Fig. 3 corresponding to 30B, 32B, 34B, 36B, 38B of Fig. 5) depending on the comparison result (see Page 4, Para. [0042]-[0050]), wherein the timing controller (40, G1, G2; see Fig. 5) does not provide the nth image data (i.e., pixel data of the next pixel) to the data driver (i.e., 20 in Fig. 3 corresponding to 30B, 32B, 34B, 36B, 38B of Fig. 5) when all bits of the nth image data (i.e., pixel data of the next pixel) and the (n-1)th image data (i.e., pixel data of the previous pixel) are complementary to each other (see Page 4, Para. [0049]-[0050]). Like Montalbo, Sekido discloses that the primary goal of the invention is to reduce power consumption and electromagnetic interference by reducing the transfer of data from a timing controller to a data driver (see Abstract and Page 1, Para. [0002]). Further, the inventions of Montalbo and Sekido are in the same field of endeavor. Therefore, it would have been obvious to one of ordinary skill

in the art at the time when then invention was made to combine the teachings of Montalbo with the teachings of Sekido.

Furthermore, it would have been obvious to one of ordinary skill in the art at the time when the invention was made that the technique taught by Sekido, namely not providing the  $n$ th image data to the data driver when all bits of the  $n$ th image data and the  $(n-1)$ th image data are complementary to each other, can be implemented in the timing controller of Montalbo. That is, implementing the teachings of Sekido in the timing controller of Montalbo constitutes the use of a known technique to improve a similar device in the same way.

In addition, while it is well known in the art that the gate lines and the data lines are insulated from each other, neither Montalbo nor Sekido explicitly state this feature. However, Hiraki discloses a liquid crystal display (see Fig. 3, Fig. 4, and Fig. 5) comprising: a liquid crystal panel assembly (40) including a plurality of gate lines (12), a plurality of data lines (13) which are insulated from and intersects the gate lines (12; see Col. 7, Ln. 48-53), and a plurality of pixels (herein referred to as picture elements) each of which is formed in an area defined by a data line (13) of the data lines (13) and a gate line (12) of the gate lines (12) and has a switching element (15) connected to the gate line (12) and the data line (13; Col. 7, Ln. 41-67). The teachings of Montalbo, Sekido, and Hiraki are in the same field of endeavor. Further, Hiraki provides a description of a feature common in liquid crystal displays. Therefore, it would have been

Art Unit: 2629

obvious to one of ordinary skill in the art at the time when the invention was made to combine the teachings of Montalbo, Sekido, and Hiraki.

8. As pertaining to **Claim 2**, the combined teachings of Montalbo and Sekido disclose (see Fig. 5 of Montalbo, for example) that the timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 and (700) of Fig. 7 of Montalbo) generates an operation control signal (552, 562, 572 of Montalbo) based on the comparison result (i.e., the result of comparing the  $n$ th image data (i.e., current pixel data (520)) applied from outside and  $(n-1)$ th image data (i.e., previous pixel data (510) as disclosed by Montalbo) and provides the operation control signal (552, 562, 572 of Montalbo) to the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo) and the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo) is operated with a mode (see (540) in Fig. 5 of Montalbo), based on the operation control signal (552, 562, 572 of Montalbo), selected from a holding mode (572 of Montalbo) which provides data voltages corresponding to the stored  $(n-1)$ th image data (i.e., the previous pixel data as disclosed by Montalbo; see Col. 6, Ln. 46-67 through Col. 7, Ln. 1-54 of Montalbo), an inverting mode (i.e., (DINV) as disclosed by Sekido; see Fig. 5 of Sekido) which provides data voltages corresponding to the inverted  $(n-1)$ th image data (i.e., inverted pixel data of the previous pixel; see Page 4, Para. [0049]-[0050] of Sekido), and an updating mode (552 of Montalbo; see Fig. 5 of Montalbo) which provides data voltages corresponding to the  $n$ th

Art Unit: 2629

image data (i.e., the current pixel data as disclosed by Montalbo) provided from the timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 of Montalbo; and again, see Col. 6, Ln. 46-67 through Col. 7, Ln. 1-54 of Montalbo).

9. As pertaining to **Claim 3**, Montalbo and Sekido disclose (see Fig. 5 and Fig. 7 of Montalbo) that the timing controller (see (500) of Fig. 5 corresponding to (700) of Fig. 7 of Montalbo) can include:

- a first line memory (see (710, 720) in Fig. 7 of Montalbo) for storing the nth image data (i.e., the current line's data) applied from outside;

- a second line memory (see 722, 729 in Fig. 7 of Montalbo) in which the (n-1)th image data (i.e., the previous line's data) applied in advance are stored (see Col. 7, Ln. 1-54 in conjunction with Col. 9, Ln. 14-67 of Montalbo); and

- a control signal generator (see (752, 762, 772, 792 of Fig. 7 of Montalbo) for generating an operation control signal (i.e., 752, 762, 772, 792) after comparing the nth image data (i.e., the current line's data) and the (n-1)th image data (i.e., the previous line's data; again, see Col. 7, Ln. 1-54 in conjunction with Col. 9, Ln. 14-67 of Montalbo); and

- the control signal generator (see (752, 762, 772, 792 of Fig. 7 of Montalbo) that generates:

- an operation control signal (792) of a first status (i.e., a hold status) to let the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo) operate with the holding mode (i.e., repeat last

Art Unit: 2629

line) when all bits of the nth image data (i.e., the current line's data) and the (n-1)th image data (i.e., the previous line's data) are equal to each other (again, see Col. 7, Ln. 1-54 in conjunction with Col. 9, Ln. 14-67 of Montalbo);

an operation control signal (i.e., (DINV) as disclosed by Sekido; see Fig. 5 of Sekido) of a second status (i.e., a hold and invert status) to let the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo) operate with the inverting mode when all bits of the nth image data (i.e., the current line's data) and the (n-1)th image data (i.e., the previous line's data) are complementary to each other (see Page 4, Para. [0049]-[0050] of Sekido); and

an operation control signal (752) of a third status (i.e., an update status) to let the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo) operate with the updating mode (i.e., video data output) when at least one bit of the nth image data (i.e., the current line's data) and at least one corresponding bit of the (n-1)th image data (i.e., the previous line's data) are not equal or complementary to each other (again, see Col. 7, Ln. 1-54 in conjunction with Col. 9, Ln. 14-67 of Montalbo);

10. As pertaining to **Claim 5**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 7 of Montalbo; and see Fig. 2 and Fig. 5 of Sekido) that timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 of Montalbo) generates an operation control signal (i.e., see (792) of Fig. 7 of Montalbo; see (DINV) of Fig. 5 of Sekido) whose status changes by

Art Unit: 2629

1H period (i.e., one horizontal period) by comparing the  $n$ th image data (i.e., the current line's pixel data) and the  $(n-1)$ th image data (i.e., the previous line's pixel data) during 1H period (i.e., during one horizontal period) and the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) holds, inverts, or updates the image data by 1H period (i.e., by one horizontal period; see Col. 1, Ln. 19-48 and Col. 2, Ln. 8-20 in conjunction with Col. 9, Ln. 14-67 of Montalbo; i.e., the pixel data is held or updated at the data driver one horizontal line at a time; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0032], [0036], and [0040], and Page 4, Para. [0042]-[0043] of Sekido).

11. As pertaining to **Claim 6**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 6-8 of Montalbo; and see Fig. 2, Fig. 3 and Fig. 5 of Sekido) that timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 of Montalbo) generates an operation control signal (i.e., see (752, 772, 792) of Fig. 7 of Montalbo; see (DINV) of Fig. 5 of Sekido) whose status changes as many times as the number of the data drivers (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) by 1H period (i.e., one horizontal period) by comparing the  $n$ th image data (i.e., the current line's pixel data) and the  $(n-1)$ th image data (i.e., the previous line's pixel data) for each data driver (see (120) of Fig. 1

Art Unit: 2629

corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) during 1H period (i.e., during one horizontal period) and the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) holds, inverts, or updates the image data for each data driver (see Col. 1, Ln. 49-67 through Col. 2, Ln. 1-20 in conjunction with Col. 9, Ln. 14-67 of Montalbo and the above mentioned figures; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0031]-[0035], and Page 4, Para. [0042]-[0046] of Sekido).

12. As pertaining to **Claim 7**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 6-8 of Montalbo; and see Fig. 2, Fig. 3 and Fig. 5 of Sekido) that timing controller (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 of Montalbo) generates an operation control signal (i.e., see (752, 772) of Fig. 7 of Montalbo; see (DINV) of Fig. 5 of Sekido) whose status changes as many times as the number of pixels of the line by 1H period (i.e., one horizontal period) by comparing the nth image data (i.e., the current line's pixel data) and the (n-1)th image data (i.e., the previous line's pixel data) for each pixel during 1H period (i.e., during one horizontal period) and the data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) holds, inverts, or updates the image data for each

Art Unit: 2629

pixel (see Col. 1, Ln. 19-48 through Col. 2, Ln. 1-20 in conjunction with Col. 7, Ln. 19-67 and Col. 9, Ln. 14-67 of Montalbo; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0031]-[0035], and Page 4, Para. [0042]-[0050] of Sekido).

13. As pertaining to **Claim 11**, Montalbo discloses (see Fig. 3c) that the image data is transmitted to the data driver by RSDS (reduced swing differential signaling; see Abstract and Col. 5, Ln. 40-51).

14. As pertaining to **Claim 12**, Montalbo discloses (see Fig. 1 and Fig. 2) a driving method of a liquid crystal display (see Col. 1, Ln. 14-18) which includes a plurality of gate lines (i.e., row lines), a plurality of data lines (i.e., column lines) which intersects the gate lines (i.e., row lines; see Col. 1, Ln. 19-48), and a plurality of pixels each of which is formed in an area defined by a data line (i.e., column line) of the data lines (i.e., column lines) and a gate line (i.e., row line) of the gate lines (i.e., row lines) and has a switching element (i.e., TFT) connected to the gate line (i.e., row line) and the data line (i.e., column line; again, see Col. 1, Ln. 19-48), the method comprising:

providing (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3) data voltages according to image data (i.e., pixel data) to the data line (i.e., column line; see Col. 1, Ln. 19-60);

Art Unit: 2629

making the data voltage be applied to the pixel by providing (see (150)) a gate voltage (i.e., driving voltage) to the gate line (i.e., row line; again, see Col. 1, Ln. 19-48);

wherein the provision includes:

comparing (see (130) of Fig. 1 corresponding to (330) of Fig. 3 corresponding to (500) of Fig. 5 and (700) of Fig. 7) (n-1)th image data (i.e., previous pixel data (510)) provided in advance and nth image data (i.e., current pixel data (520)) being provided currently (see (540) of Fig. 5, for example; also see Col. 6, Ln. 66-67 through Col. 7, Ln. 1-54 and Col. 9, Ln. 14-67);

providing data voltages corresponding to the (n-1)th image data (i.e., previous pixel data (510)) to the data line (i.e., column line) when all bits of the nth image data (i.e., current pixel data (520)) and the (n-1)th image data (i.e., previous pixel data (510)) are equal to each other (again, see Col. 6, Ln. 66-67 through Col. 7, Ln. 1-54 and Col. 9, Ln. 14-67); and

providing data voltages corresponding to the nth image data (i.e., current pixel data (520)) to the data line (i.e., column line) when at least one bit of the nth image data (i.e., current pixel data (520)) and at least one corresponding bit of the (n-1)th image data (i.e., previous pixel data (510)) are not equal to each other (again, see Col. 6, Ln. 66-67 through Col. 7, Ln. 1-54 and Col. 9, Ln. 14-67); and

Montalbo does not explicitly disclose inverting the (n-1)th image data (i.e., the previous image data) and providing data voltages corresponding thereto when all bits of the nth image data (i.e., the current image data) and the (n-1)th

Art Unit: 2629

image data (i.e., the previous image data) are complementary to each other. Moreover, Montalbo does not explicitly state providing data voltages corresponding to the nth image data (i.e., current pixel data (520)) to the data line (i.e., column line) when at least one bit of the nth image data (i.e., current pixel data (520)) and at least one bit of the (n-1)th image data (i.e., previous pixel data (510)) are not complementary to each other. However, Montalbo does disclose that the primary goal of the invention is to reduce power consumption and electromagnetic interference by reducing the transfer of data from the timing controller to the data driver (see Col. 6, Ln. 34-65).

Sekido discloses (see Fig. 1, Fig. 3, and Fig. 5) a method of driving a liquid crystal panel assembly (1; see Fig. 1) including a plurality of gate lines (5), a plurality of data lines (6) which intersects the gate lines (5), and a plurality of pixels (3) each of which is formed in an area defined by a data line (6) of the data lines (6) and a gate line (5) of the gate lines (5) and has a switching element (i.e., TFT; 4) connected to the gate line (5) and the data line (6; see Page 2, Para. [0024]-[0025]). Further, Sekido discloses that the assembly comprises a gate driver (22; see Fig. 3) for supplying gate voltages to the gate lines (5) and at least one data driver (20; see Fig. 3) for supplying data voltages corresponding to image data to the data lines (see Page 3, Para. [0031] and [0034]). Sekido discloses a timing controller (implicit in (40, G1, G2; see Fig. 5) for comparing nth image data (i.e., pixel data of the next pixel) applied from outside and (n-1)th image data (i.e., pixel data of the previous pixel) stored therein and selectively providing the nth image data (i.e., pixel data of the next pixel) to the data driver

Art Unit: 2629

(i.e., 20 in Fig. 3 corresponding to 30B, 32B, 34B, 36B, 38B of Fig. 5) depending on the comparison result (see Page 4, Para. [0042]-[0050]), wherein the timing controller (40, G1, G2; see Fig. 5) provides for inverting the (n-1)th image data (i.e., the pixel data of the previous pixel) and providing data voltages corresponding thereto when all bits of the nth image data (i.e., pixel data of the next pixel) and the (n-1)th image data (i.e., pixel data of the previous pixel) are complementary to each other (see Page 4, Para. [0049]-[0050]); and providing data voltages corresponding to the nth image data (i.e., pixel data of the next pixel) to the data line when at least one bit of the nth image data (i.e., pixel data of the next pixel) and at least one corresponding bits of the (n-1)th image data (i.e., pixel data of the previous pixel) the previous image data) are not complementary to each other (again, see Page 4, Para. [0042]-[0050]). Like Montalbo, Sekido discloses that the primary goal of the invention is to reduce power consumption and electromagnetic interference by reducing the transfer of data from a timing controller to a data driver (see Abstract and Page 1, Para. [0002]). Further, the inventions of Montalbo and Sekido are in the same field of endeavor. Therefore, it would have been obvious to one of ordinary skill in the art at the time when then invention was made to combine the teachings of Montalbo with the teachings of Sekido.

Furthermore, it would have been obvious to one of ordinary skill in the art at the time when the invention was made that the technique taught by Sekido, namely not providing the nth image data to the data driver when all bits of the nth image data and the (n-1)th image data are complementary to each other, can be

Art Unit: 2629

implemented in the timing controller of Montalbo. That is, implementing the teachings of Sekido in the timing controller of Montalbo constitutes the use of a known technique to improve a similar device in the same way. As such, the combined teachings of Montalbo and Sekido disclose providing data voltages corresponding to the  $n$ th image data to the data line when at least one bit of the  $n$ th image data and at least one corresponding bit of the  $(n-1)$ th image data are not equal or complementary to each other.

In addition, while it is well known in the art that the gate lines and the data lines are insulated from each other, neither Montalbo nor Sekido explicitly state this feature. However, Hiraki discloses a liquid crystal display (see Fig. 3, Fig. 4, and Fig. 5) comprising: a liquid crystal panel assembly (40) including a plurality of gate lines (12), a plurality of data lines (13) which are insulated from and intersects the gate lines (12; see Col. 7, Ln. 48-53), and a plurality of pixels (herein referred to as picture elements) each of which is formed in an area defined by a data line (13) of the data lines (13) and a gate line (12) of the gate lines (12) and has a switching element (15) connected to the gate line (12) and the data line (13; Col. 7, Ln. 41-67). The teachings of Montalbo, Sekido, and Hiraki are in the same field of endeavor. Further, Hiraki provides a description of a feature common in liquid crystal displays. Therefore, it would have been obvious to one of ordinary skill in the art at the time when the invention was made to combine the teachings of Montalbo, Sekido, and Hiraki.

Art Unit: 2629

15. As pertaining to **Claim 13**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 7 of Montalbo; and see Fig. 2 and Fig. 5 of Sekido) that the provision compares the nth image data (i.e., the current line's pixel data) and the (n-1)th image data (i.e., the previous line's pixel data) during 1H period (i.e., during one horizontal period; see Col. 1, Ln. 19-48 and Col. 2, Ln. 8-20 in conjunction with Col. 9, Ln. 14-67 of Montalbo; i.e., the pixel data is held or updated at the data driver one horizontal line at a time; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0032], [0036], and [0040], and Page 4, Para. [0042]-[0043] of Sekido).

16. As pertaining to **Claim 14**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 6-8 of Montalbo; and see Fig. 2, Fig. 3 and Fig. 5 of Sekido) that the provision compares the nth image data (i.e., the current line's pixel data) and the (n-1)th image data (i.e., the previous line's pixel data) for each data driver (see (120) of Fig. 1 corresponding to (200) of Fig. 2 corresponding to (320) of Fig. 3 of Montalbo; see (20) in Fig. 3 corresponding to (30B, 32B, 34B, 36B, 38B) of Fig. 5 of Sekido) of the liquid crystal display during 1H period (i.e., during one horizontal period; see Col. 1, Ln. 49-67 through Col. 2, Ln. 1-20 in conjunction with Col. 9, Ln. 14-67 of Montalbo and the above mentioned figures; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0031]-[0035], and Page 4, Para. [0042]-[0046] of Sekido).

Art Unit: 2629

17. As pertaining to **Claim 15**, both Montalbo and Sekido disclose (see Fig. 1, Fig. 2, and Fig. 6-8 of Montalbo; and see Fig. 2, Fig. 3 and Fig. 5 of Sekido) that the provision compares the nth image data (i.e., the current line's pixel data) and the (n-1)th image data (i.e., the previous line's pixel data) for each pixel during 1H period (i.e., during one horizontal period; see Col. 1, Ln. 19-48 through Col. 2, Ln. 1-20 in conjunction with Col. 7, Ln. 19-67 and Col. 9, Ln. 14-67 of Montalbo; also see Page 2, Para. [0029]-[0030], Page 3, Para. [0031]-[0035], and Page 4, Para. [0042]-[0050] of Sekido).

18. **Claim 10** is rejected under 35 U.S.C. 103(a) as being unpatentable over Montalbo in view of Sekido in view of Hiraki and further in view of Terukina et al. (hereinafter "Terukina" US 6,624,868).

19. As pertaining to **Claim 10**, Montalbo discloses that typical display driver circuit chips are mounted on the glass of the liquid crystal display panel (see Col. 1, Ln. 36-38). While chip on glass (COG) structures are well known in liquid crystal displays, none of Montalbo, Sekido, nor Hiraki explicitly state that the liquid crystal display has a COG (chip on glass) structure.

However, Terukina discloses a liquid crystal display with a chip-on-glass (COG) structure (see Fig. 4) in which the chips for driving the liquid crystal display panel are mounted on a glass substrate (Col. 1, Ln. 14-45). Terukina

Art Unit: 2629

explicitly states that COG structures are well known in the art (see Col. 1, Ln. 7-19). Therefore, it would have been obvious to one of ordinary skill in the art at the time when the invention was made to combine the teachings of Montalbo, Sekido, and Hiraki with the teachings of Terukina as a means of applying a known technique (i.e., the COG structure) to a known device (i.e., a liquid crystal display) to yield predictable results (i.e., the improvements disclosed by Terukina; see Col. 1, Ln. 34-64).

### ***Conclusion***

20. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Lee et al. (US 2006 / 0028416) discloses a liquid crystal display wherein present data is compared to previous data to determine whether or not to send data to a data driver.
